Behrooz Parhami Introduction Parallel Processing

Roll back time a half-century or so and the smallest computer in the world was a gargantuan machine that filled a room. When transistors and integrated circuits were developed, computers could pack the same power into microchips as big as your fingernail. So what if you build a room-sized computer today and fill it full of those same chips? What you get is a supercomputer — a computer that's ...

How do supercomputers work? - Explain that Stuff

Linear probing is a scheme in computer programming for resolving collisions in hash tables, data structures for maintaining a collection of key-value pairs and looking up the value associated with a given key. It was invented in 1954 by Gene Amdahl, Elaine M. McGraw, and Arthur Samuel and first analyzed in 1963 by Donald Knuth. Along with quadratic probing and double hashing, linear probing ...
