We have observed that an increase in the tension of a string causes an increase in the velocity that waves travel on the string. In this activity we will examine the precise relationship between tension (T) the force applied to the string, the wave speed (v w) and the linear mass density of the string ($\mu = m/L$ which is measured in kg/m).

Shown below are two in-phase, coherent sound sources. This fact that each source emits the same

wavelength can be verified by noting that the distance from a crest/compression to its next crest/compression is the same for both sources.

The most important of the design parameters is the design of the cabinet: Length and geometry to set the tuning frequency -- Tuning frequency is set by the length of the line and the geometry.. For a straight line, it is simply a quarter wave of the frequency.. A tapered line (opening has a smaller area than the closed end of the pipe) is the smallest possible enclosure for the same frequency.

Objective: To find out how waves shape the coastline. The coast is the name given to the zone where the land meets the sea/ocean. Coasts are shaped by the sea and the action of waves. The processes that take place are erosion, transportation and deposition.
